9/2/05AMENDMENTS TO THE SPECIFICATION

Please amend paragraph [0011], Page 4 at line 5 of the specification as follows:

[0011] wherein the first differential amplifier circuit receives an input signal via the first resistor and inputs an output signal to the second and third differential amplifier circuit via the second resistor, the second differential amplifier circuit drives one of the first and the second transistor, the third differential ~~transistor~~ amplifier circuit drives the other of the first and the second transistor, and an output signal of the output stage circuit is fed back to an input of the first differential amplifier circuit via the first feed back resistor and to inputs of the second and the third differential amplifier circuit via the second feed back resistor.

Please amend paragraph [0013], Page 4 at line 24 of the specification as follows:

[0013] Further, the respective differential amplifier circuits are operated at a source voltage with respect to a reference potential (ground) or at a voltage between the voltages. Thereby, a drive signal for the output stage circuit can be produced with a comparatively low voltage. Further, a double feed back circuit in which the output signal of the output stage circuit is fed back to the first ~~differential circuit~~ differential amplifier circuit as well as to the inputs of the second and the third differential amplifier circuit is constituted.

Please amend paragraph [0032], Page 10 at line 19 of the specification as follows:

[0032] In the present embodiment, the transistor T_{rp} is driven by a voltage signal less than $+VDD/2$ among input signals of the differential amplifier circuit 2 and is
